

Due to the increase in attacks on warehouse fire exit doors, **Simtec Solutions Limited** have recently developed an internal, high secure locking bar system that prevents the door from being levered open from the outside. This is achieved by simply placing a heavy duty, easy to handle cross rail into a custom made tamper resistant steel cradle. The cradle is secured to the door by heavy duty steel plates with fully welded concealed fixings.

Once the **Simbar** is fitted by placing it into the receiver channel, the system firmly locks into both sides of the door reveal.

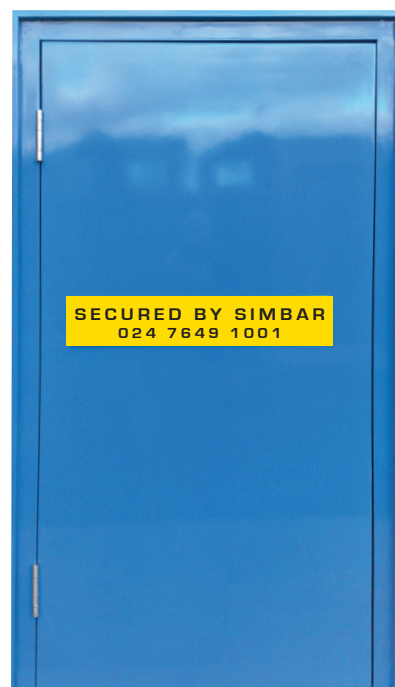

To remove the **Simbar**, simply lift up the crossrail with the easy to use handle and place in its storage cradle beside the door.

Simbar simply locks down all emergency exits doors, when a premises is being shut down during out of work hours.

The system is currently being specified by National Distribution Warehouses.

All components are polyester powder coated yellow as standard, (other colours on request.) With protected by Simbar displayed on the front of the external door face plate.
